ELECTRICAL PANEL

SACMI for a longer equipment lifetime

Get rid of your press old **electrical panel** by replacing it with a new one. With the solution provided by SACMI, replacement is **quick** and the return on investment **immediate**. With this simple operation, and thanks to the new connectivity functions, it is also possible to access the new **kits with high added value** available on the latest generation of SACMI presses. Revamping available for **SACMI presses** from PH690 to PH3590.

Continued production

ADVANTAGES

- Possibility to interface with new generation factory **supervisors** and other units in the department (**Powerlink** standard)
- It **simplifies** the search for spare parts (due to commonly used components installed in the new systems), eliminating the problem of obsolete electronic boards
- It increases the **usability of the machine**, thanks to the digital interface and uniformity of the systems

ELECTRICAL PANEL

Technical features

Replacing the electrical panel helps bring the machine up to the latest **standards of connectivity and usability** of the press. The system is based on the **Ethernet-Powerlink field bus**, the same as on all new generation machines, ensuring maximum speed in data exchange and all required connectivity functions. The operation also solves the important problem of **obsolete electronic boards**, standardising the spare parts and bringing them into line with those of new generation machines. The **plug&play** system is designed to eliminate the need to replace the entire system. The operator interface - **digital touchscreen** - is also aligned with the new systems, simplifying handling and usability for the operator.
